

Case Study: Diabetic Retinopathy

Dr. Ahooja and Dr. Sashi

Dr AHOOJA EYE CLINIC, GURGOAN, HARAYANA, INDIA

Introduction

A 55-year-old Indian male with a 10-year history of diabetes and hypertension presented with complaint of vision loss in his left eye.

Examination and conclusion

On fundus examination, diabetic retinopathy was seen along with a diabetic papillopathy. FFA was done using the Smartscope FA to document the changes of diabetic retinopathy.

The FFA shows moderate non proliferative diabetic retinopathy along with a mild papillopathy in the form of peripapillary hemorrhages. The foveal avascular zone appears intact and there is no evidence of macular oedema.
